		<p><u>Important Instructions to examiners:</u></p> <p>1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.</p> <p>2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.</p> <p>3) The language errors such as grammatical, spelling errors should not be given more Importance <u>(Not applicable for subject English and Communication Skills)</u>.</p> <p>4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.</p> <p>5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.</p> <p>6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.</p> <p>7) For programming language papers, credit may be given to any other program based on equivalent concept.</p>

1.		Attempt any NINE of the following:		18																		
	a)	<p>Write two applications of copper.</p> <p>1) For making electrical wires, cables and conducting apparatus. 2) As a coinage metal and in ornaments, jewelry for making them hard. 3) For making water stills, kettles, vacuum pans, steam pipes and fire boxes of locomotive engines. 4) In electroplating and electrotyping. 5) Copper salts are largely used as insecticides and coloring materials. 6) For making scientific apparatus such as hypsometers, colorimeters, etc. 7) For making alloys like brass, bronze, gun metal, etc.</p>	1 Mark each	2																		
	b)	<p>Write two ores of copper with their chemical formulae.</p> <table border="1"> <thead> <tr> <th>Sr .No.</th> <th>Name of the ore</th> <th>Chemical formula</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Cuprite or ruby copper</td> <td>Cu₂O</td> </tr> <tr> <td>2</td> <td>Copper glance</td> <td>Cu₂S</td> </tr> <tr> <td>3</td> <td>Copper pyrite</td> <td>CuFeS₂</td> </tr> <tr> <td>4</td> <td>Malachite</td> <td>CuCO₃.Cu(OH)₂</td> </tr> <tr> <td>5</td> <td>Azurite</td> <td>2CuCO₃.Cu(OH)₂</td> </tr> </tbody> </table> <p>(Any two ores of Copper with formula: 1 mark each)</p>	Sr .No.	Name of the ore	Chemical formula	1	Cuprite or ruby copper	Cu ₂ O	2	Copper glance	Cu ₂ S	3	Copper pyrite	CuFeS ₂	4	Malachite	CuCO ₃ .Cu(OH) ₂	5	Azurite	2CuCO ₃ .Cu(OH) ₂	1 Mark each	2
Sr .No.	Name of the ore	Chemical formula																				
1	Cuprite or ruby copper	Cu ₂ O																				
2	Copper glance	Cu ₂ S																				
3	Copper pyrite	CuFeS ₂																				
4	Malachite	CuCO ₃ .Cu(OH) ₂																				
5	Azurite	2CuCO ₃ .Cu(OH) ₂																				
	c)	<p>Write the action of water on Aluminium.</p> <p>Pure aluminium is not affected by pure water. However, impure aluminium is readily corroded by water containing salts (seawater). It decomposes boiling water with evolution of hydrogen.</p> $2 \text{ Al } + 6 \text{ H}_2\text{O} \longrightarrow 2 \text{ Al(OH)}_3 + 3 \text{ H}_2 \uparrow$	1	2																		
	d)	<p>Define corrosion. Write its types.</p> <p>Corrosion: Any process of chemical or electrochemical decay or destruction of a metal due to the action of surrounding medium is called as corrosion.</p> <p>Types of corrosion:</p> <p>1) Atmospheric corrosion (or direct chemical corrosion or Dry corrosion) 2) Immersed corrosion (or electro chemical corrosion or wet corrosion)</p>	1 ½ mark each	2																		

Que. No.	Sub. Que.	Model Answer	Marks	Total Marks
1.	e)	Why galvanized containers cannot be used for storage of foodstuff? Galvanized containers (zinc coated) cannot be used for preparing and storing food stuff, which are acidic in nature because zinc gets dissolved in dilute acids in food forming poisonous zinc compounds which will poison the content.	2	2
	f)	Which oxide film is most protective against corrosion? Why? Non-porous stable oxide film is most protective oxide film. This oxide film is extremely adherent and non-porous (protective). Due to the absence of pores or cracks in the oxide film, it forms barrier for further action and therefore, the rate of corrosion of metal decreases rapidly.	1 1	2
	g)	State the factors affecting the rate of electrochemical corrosion. i) Position of metal in electrochemical series ii) Purity of metal iii) Solubility of corrosion product iv) Nature of oxide film v) Relative areas of anode and cathode vi) Physical state of the metal vii) Effect of pH viii) Differential aeration ix) Conductance of the medium x) Presence of impurities in the atmosphere xi) Presence of moisture in the atmosphere (Any two factors)	1 Mark each	2
	h)	Define specific conductance. Write its unit. Specific conductance is the conductance offered by 1 cm ³ of the substance or 1ml solution. OR The conductance offered by a solution or a conducting material having unit length & unit area of cross section is known as specific conductance . Unit of specific conductance: ohm ⁻¹ cm ⁻¹ or mhos-cm ⁻¹ or S.cm ⁻¹	1 1	2
	i)	Why does a dry cell become dead after a long time, even if it has not been used? Dry cell become dead after a long time, even if it has not been used because acidic NH ₄ Cl corrodes the zinc vessel.	2	2

They can be recharged & reused.	6. e.g. Dry cell, Daniel cell, Leclanche cell	6. e.g. Lead acid storage cell, Nickel- cadmium storage cell	1 mark each	4
Primary cell	Secondary cell																	
1. Non- rechargeable cells are known as primary cells	1. Rechargeable cells are known as secondary cells.																	
2. Chemical reaction is irreversible.	2. Chemical reaction is reversible.																	
3. They are light in weight.	3. They are heavy.																	
4. They have short life.	4. They have long life																	
5. They can not be recharged & reused.	5. They can be recharged & reused.																	
6. e.g. Dry cell, Daniel cell, Leclanche cell	6. e.g. Lead acid storage cell, Nickel- cadmium storage cell																	
	f)	<p>Describe construction and working of Daniel cell with the help of diagram.</p> <div style="text-align: center;"> </div> <p>Construction:- It consists of zinc electrode dipped in ZnSO₄ Solution & copper electrode dipped in CuSO₄ solution. The two solutions are separated by a porous pot. The two solutions can seep through the pot & so comes in contact with each other automatically. Thus, porous partition acts as a salt bridge.</p>	1	4														

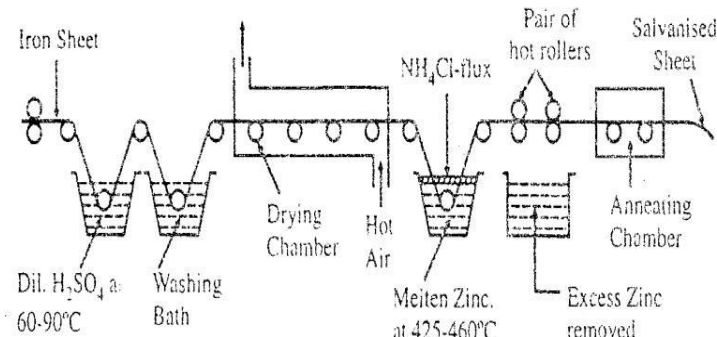

Que. No.	Sub. Que.	Model Answer	Marks	Total Marks
2.	f)	<p>Working:- The tendency of Zn to form Zn⁺⁺ is greater than the tendency of Zn⁺⁺ to get deposited as Zn on the electrode. Therefore Zn goes into the solution forming Zn⁺⁺. On the other hand tendency of copper to go into the solution is less than the tendency of Cu⁺⁺ to get deposited as Cu & hence copper electrode becomes positively charged.</p> <p>The emf of cell is 1.1 volt.</p> <p>Cell reactions:-</p> <p>At Anode: Zn \longrightarrow Zn⁺⁺ + 2e⁻</p> <p>At Cathode: Cu⁺⁺ + 2e⁻ \longrightarrow Cu</p> <hr style="width: 50%; margin-left: 0;"/> <p>Net Reaction: Zn + Cu⁺⁺ \longrightarrow Zn⁺⁺ + Cu</p>	2	
3	a)	<p>Attempt any FOUR of the following.</p> <p>Explain mechanism of immersed corrosion with evolution of hydrogen gas.</p> <div style="text-align: center;"> </div>	1	16
		<p>Steel tank: - Anode</p> <p>Cu – strip:- Cathode</p> <p>Such type of corrosion occurs usually in acidic environments like acidic industrial waste, solutions of non – oxidizing acids. Consider a steel tank containing acidic industrial waste and small piece of copper scrap in contact with steel. The portion of the steel tank in contact with copper is corroded most with the evolution of hydrogen gas.</p>	1	4

Que. No.	Sub. Que.	Model Answer	Marks	Total Marks
3	a)	<p>Reactions: At Anode: $\text{Fe} \longrightarrow \text{Fe}^{++} + 2\text{e}^{-}$</p> <p>These electrons flow through the metal from anode to the cathode At cathode: H^{+} ions are eliminated as H_2 gas $2\text{H}^{+} + 2\text{e}^{-} \longrightarrow \text{H}_2\uparrow \text{(Reduction)}$ Thus, over all reaction is $\text{Fe} + 2\text{H}^{+} \longrightarrow \text{Fe}^{++} + \text{H}_2\uparrow$</p> <p>[Note: 1mark each to be given to reaction at anode & cathode.]</p>	1	4
	b)	<p>Describe mechanism of corrosion of metal due to action of oxygen.</p> <div style="text-align: center;"> </div> <p>Mechanism: When metal atoms present on the metal surface comes in contact with the atmospheric oxygen then they undergo oxidation liberating electrons. The electrons lost by metal atoms are then accepted by atmospheric oxygen to form oxide ion (O^{2-}). The metal ion M^{2+} & oxide ion O^{2-} then combines together due to electrostatic force of attraction to form metal oxide molecule. Thus as a result of atmospheric corrosion due to oxygen there is formation of A thin layer of metal oxide on the surface of metal</p>	1	
		$\text{M} \longrightarrow \text{M}^{2+} + 2\text{e}^{-} \text{ (loss of electrons)}$ $\frac{1}{2}\text{O}_2 + 2\text{e}^{-} \longrightarrow \text{O}^{2-} \text{ (gain of electrons)}$ <hr/> $\text{M} + \text{O} \longrightarrow \text{M}^{2+} + \text{O}^{2-} \longrightarrow \text{MO (Metal oxide)}$	2	

Summer-2016

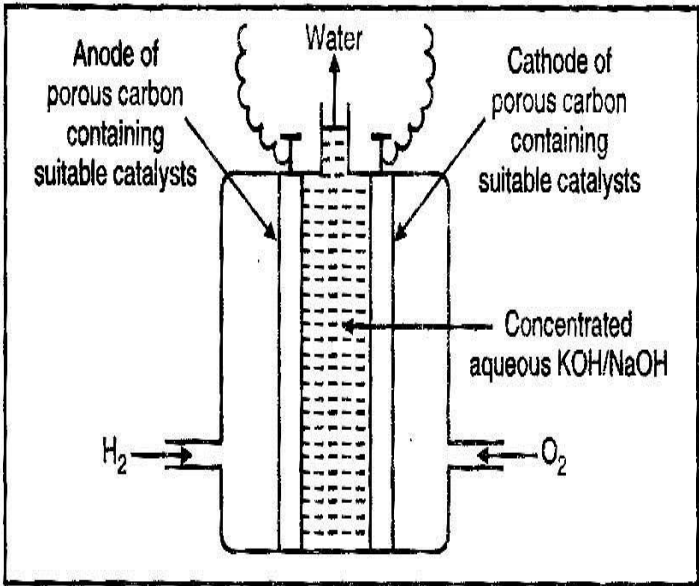

Subject Code: 17211

Page No: 10/12

Que. No.	Sub. Que.	Model Answer	Marks	Total Marks
3.	c)	<p>Describe galvanizing process with suitable diagram.</p> <div style="text-align: center;">  </div> <p>It is the process of coating iron or steel sheets with a thin coat of zinc to prevent it from rusting.</p> <p>Process: The iron or steel sheet to be galvanized is first cleaned with dilute H₂SO₄ to remove any oxide layer or impurities. It is then washed with water to remove acid completely. It is then passed through drier to dry it completely. Then it is dipped in a bath of ammonium chloride solution which helps in adhesion of the molten zinc particles to steel sheet. It is then dipped in a bath of molten zinc at 425^oC to 460^oC temperature and passed through series of rollers to remove excess zinc and in order to get uniform coating. Finally it is annealed at 650^oC.</p>	2	4
	d)	<p>Explain discharging and charging process of lead acid storage cell.</p> <p>Discharging: - While discharging chemical energy gets converted into electrical energy.</p> <p>At anode: - The lead electrode loses electrons, which flow through the wire. $\text{Pb} \rightarrow \text{Pb}^{2+} + 2\text{e}^-$ The Pb²⁺ ions then react with sulphate SO₄²⁻ ions $\text{Pb}^{2+} + \text{SO}_4^{2-} \rightarrow \text{PbSO}_4 + 2\text{e}^-$ The electrons released from the anode flow to the cathode electrode.</p> <p>At cathode:- Lead undergoes reduction at the cathode from oxidation state +4 (PbO₂) to +2 (PbSO₄). $\text{PbO}_2 + 4\text{H}^+ + 2\text{e}^- \rightarrow \text{Pb}^{2+} + 2\text{H}_2\text{O}$ The Pb²⁺ ions then combine with SO₄²⁻ ions. $\text{Pb}^{2+} + \text{SO}_4^{2-} \rightarrow \text{PbSO}_4$</p> <p>Net reaction during Discharging: - $\text{Pb} + \text{PbO}_2 + 4\text{H}^+ + 2\text{SO}_4^{2-} \rightarrow 2\text{PbSO}_4 + 2\text{H}_2\text{O} + \text{Energy}$ Lead sulphate is precipitated at both the electrodes. As sulphuric acid is utilized & H₂O is formed in the process, concentration of H₂SO₄ will decrease, then battery should be charged.</p>	2	4

Que. No.	Sub. Que.	Model answers	Marks	Total Marks
3.	d)	<p>Charging: - To recharge a lead storage cell, the reactions taking place during discharging are reversed by passing an external e.m.f. greater than 2 volts from a generator.</p> <p>At anode $\text{PbSO}_4 + 2\text{e}^- \rightarrow \text{Pb} + \text{SO}_4^{2-}$</p> <p>At cathode $\text{PbSO}_4 + 2\text{H}_2\text{O} + 2\text{e}^- \rightarrow \text{PbO}_2 + 4\text{H}^+ + 2\text{SO}_4^{2-}$</p> <p>Net reaction during Charging: $2\text{PbSO}_4 + 2\text{H}_2\text{O} + \text{Energy} \rightarrow \text{Pb} + \text{PbO}_2 + 4\text{H}^+ + 2\text{SO}_4^{2-}$ Thus H_2SO_4 is regenerated & specific gravity will go on increasing. When it comes to 1.215, cell is said to be charged fully.</p> <p>The net reaction of Discharging & Charging is : $\text{Pb} + \text{PbO}_2 + 2\text{H}_2\text{SO}_4 \rightleftharpoons 2\text{PbSO}_4 + 2\text{H}_2\text{O}$</p>	2	
	e)	<p>Write two characteristics and two uses of Ni-Cd battery.</p> <p>Characteristics:</p> <ol style="list-style-type: none">1. The e.m.f. of cell is 1.4 V when fully charged.2. It has low internal resistance & longer life span (5 years).3. It is expensive in cost.4. It can be recharged because no products are lost and no gas is evolved. The reaction products stick to the electrodes. <p>(Any two characteristics)</p> <p>Uses:</p> <ol style="list-style-type: none">1. It is used in industrial services such as trucks, mine locomotives.2. It is used in railway car lighting and air conditioning because of its long life & low maintenance cost.3. It is widely used in calculators.	2	4
	f)	<p>Describe construction and working of hydrogen-oxygen fuel cell.</p> <p>Construction :-</p> <ol style="list-style-type: none">i) One of the simplest & most successful fuel cell is hydrogen – oxygen fuel cell.ii) It consists essentially of an electrolytic solution such as 25% KOH or NaOH solution, & two inert porous electrodes (like porous carbon) containing suitable catalyst.iii) Hydrogen & oxygen gases are bubbled through the anode & cathode compartment respectively.	1	4
